DETAILED ACTION

1. This Office Action is made in response to applicant's amendment filed on 4/27/2007. Claims 1-21 are currently pending in the application. An action follows below:

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

- (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. Claims 1-8, and 17-21 are rejected under 35 U.S.C. 103(a) as being unpatentable over Danis et al. (USPN: 6215480), hereinafter Danis.

Regarding claims 1 and 17, the Examiner notes that these claims are similarly related and can be considered together. Danis discloses a pen device with a cylindrical housing (Fig. 1, element 10) and a weight (Fig. 3, element 32) disposed within the cylindrical housing and rotationally coupled relative to the housing (col. 3, lines 28-46). The weight rotates within the cylindrical housing to measure the rotational energy of the cylindrical housing. Danis does not discuss the amount of friction between the weighted cam and the cylindrical housing; however, the amount of friction between the weight and the cylindrical housing would be set at "a desired level of friction to absorb rotational energy". The amount of friction between the housing and the weight would be selected to a desired level so that the amount of absorbed rotational energy would not

Application/Control Number: 10/814,538

Art Unit: 2629

inhibit the operation of the scrolling of the display text based on the rotation of the weight. The amount of friction between the cylindrical housing and the weight would be set to a relatively low desired level of friction.

Regarding claims 4 and 21, Danis discloses providing a weighted cam rotationally coupled within the cylindrical housing (Fig. 3, element 32; col. 3, lines 28-46). At the time of invention it would be a matter of design choice to construct the weighted cam as a single solid piece or a weight attached to a shaft allowing the weight to rotate around the axis of the shaft. In either arrangement, it would be obvious that the axis of rotation would need to be the longitudinal axis of the cylinder or parallel to that axis. Otherwise, the weighted cam would not rotate in time with the pen housing and the display would not be correctly updated with the motion of the pen. Thus, the weighted cam described by Danis could be altered into a weight coupled to a shaft and would be disposed along the long axis of the cylindrical housing for measuring the rotation of the pen.

Regarding claim 18, Danis discloses providing the weight inside the cylindrical housing to be rotationally moved (col. 3, lines 28-46).

Regarding claims 2, 3, 5-8,19, and 20, the Examiner notes that friction is caused by all surfaces in contact with one another and it would be a matter of design choice for providing a frictional surface along the surface of the weight, the cylindrical housing or along a shaft supporting the weight within the pen device. The location of frictional surfaces could be all 3 or any combination of the surfaces depending on the desired

Art Unit: 2629

level of friction and the coefficient of friction provided by the materials selected for construction of the pen.

Response to Arguments

3. Applicant's arguments filed 4/27/2007 have been fully considered but they are not persuasive regarding claims 1-8 and 17-21.

Regarding claims 1-8 and 17-21, the Examiner agrees that the weight within of Danis is not used to inhibit the rotation of the pen to cause the pen to stop in a rolling motion. However, the weight is held within the cylindrical housing and the amount of friction between the housing and the weight will be set to a desired level to allow for operation of the pen display device. This may result in a low amount of absorption of rotational energy of the cylindrical housing relative to the weight, but that would be the desired amount for operation of the pen display of Danis. Therefore, although Danis is not concerned with stopping the pen from rolling, Danis does select a desired level of friction between the weight and cylindrical housing to allow for operation of the device.

Allowable Subject Matter

4. Claims 9-16 are allowed.

The following is a statement of reasons for the indication of allowable subject matter:

The present invention is directed to a pen with a weight disposed within the housing to inhibit rolling of the pen by friction between the pen body and the weight.

Art Unit: 2629

Claim 9 identifies the uniquely distinct features "<u>a frictional element adapted to inhibit</u> movement between the weight and the cylindrical housing". The closest prior art, Danis disclose discloses a weight within a cylindrical housing but it is not expressly adapted to inhibit movement between the two elements and fails to anticipate or render the above underlined limitations obvious. Further, the Applicant's arguments filed on 4/27/2007 regarding the differences between Danis and the claimed invention are taken in consideration.

Conclusion

5. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.
